Worried about your TMR heating?

TMR's can start to heat especially when exposed to warm weather, fed out shortly after ensiling or feeding a high proportion of moist feeds

The heating is caused by secondary fermentation which spoils the feed, reducing the feed value. Once secondary fermentation begins, it won't stop!

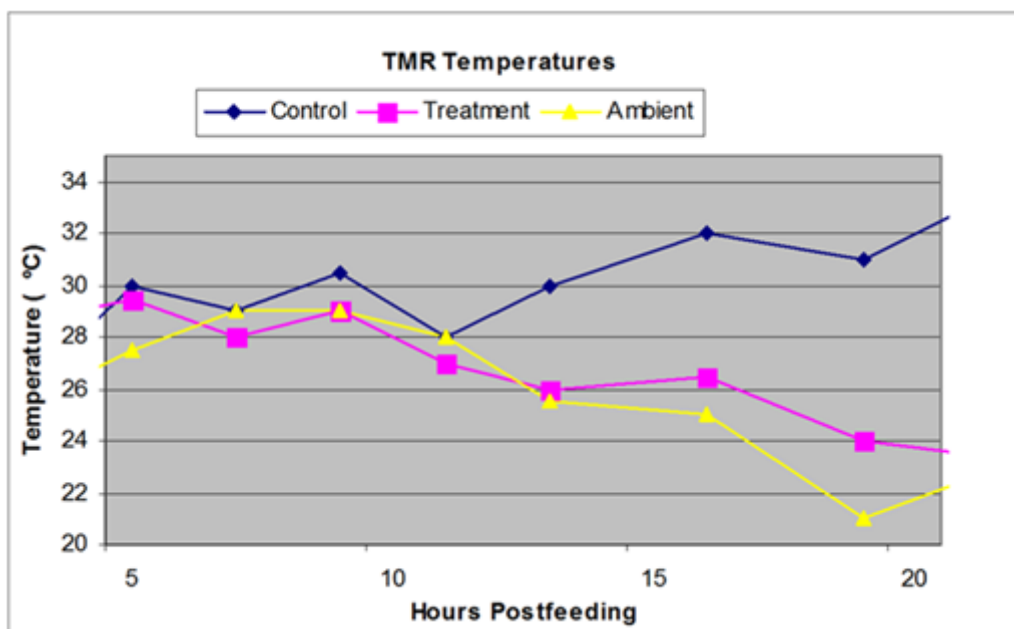

Feed intakes are reduced due to the off odour of the fermenting ration

A cow eating 1kg less DM could be producing around 2.3L less milk!

Fresh-Guard is a highly effective ration conditioner which stops a ration heating and spoiling

Fresh-Guard can be added to any bulk ED&F Man molasses based liquid feed
