Worried about your TMR heating?

TMR's can start to heat especially when exposed to warm weather, fed out shortly after ensiling or feeding a high proportion of moist feeds

The heating is caused by secondary fermentation which spoils the feed, reducing the feed value. Once secondary fermentation begins, it won't stop!

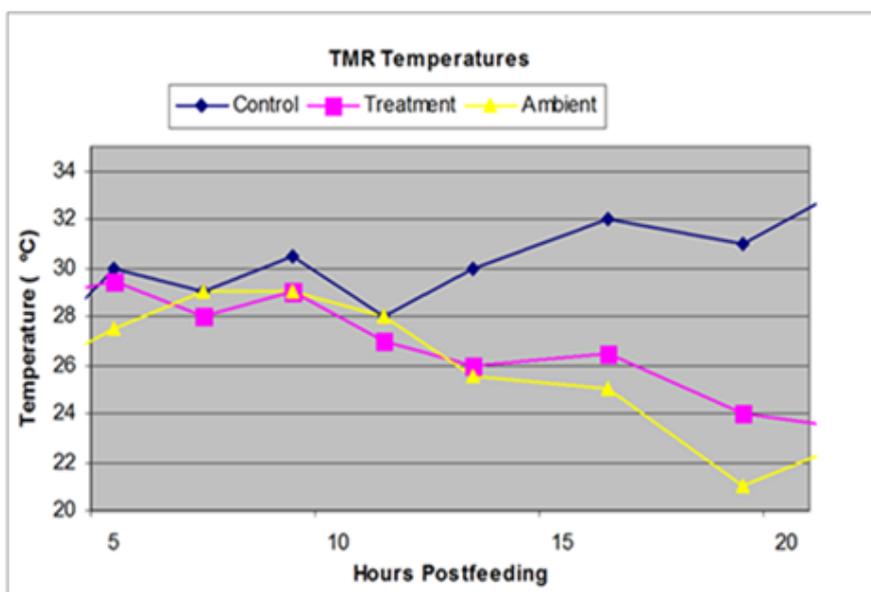

As well as reducing the dry matter intake, the TMR itself is of lower quality due to spoilage

Fresh-Guard is a ration conditioner that has been proven to reduce ration heating, microbial growth and secondary fermentation helping increase farm profitability

By using Fresh-Guard this can maintain intakes, preventing a potential lost income of up to **£15,000!** *

Fresh-Guard can be added to any bulk ED&F Man molasses based liquid feed
