

REGUMIX

A REGULATED RELEASE FEED

An 18% as fed protein liquid feed supplement balanced with high energy for mixed forage diets

Key benefits

- Excellent source of Effective Rumen Degradable Protein (ERDP) and Fermentable Metabolisable Energy (FME)
- Higher dry matter intakes and increased forage utilisation
- Cost effective alternative to a dry blend
- Better dietary protein balance
- A cost-effective supplement to optimise use of bulk feeds
- Improved animal performance and health
- Ideal combination of natural and regulated release protein

Regumix is a highly palatable, molasses based liquid feed, rich in protein and energy and designed to get the most from forages.

At 27% crude protein and 13.1ME, it is designed to complement grass, whole crop, maize silage and straw-based rations, correcting both energy and degradable protein imbalances.

TYPICAL DRY MATTER ANALYSIS

Dry matter (%)	67
Total sugars (%)	53
Crude protein (%)	27
ME (MJ/kg DM)	13.1

Original and best - a proven regulated release feed

What it can do for you

- Improve the performance of mixed forage diets
- Increase energy intake
- Enhance overall diet palatability and intakes
- Provide highly effective protein and energy supplementation at sensible cost
- Simplify feeding and save you time
- Correct ERDP deficiencies in diets

Regumix is particularly suited to total mixed rations (TMR's) where lower protein ingredients are being fed alongside grass silage. In this role, it boosts overall palatability and supplements protein and energy levels. Regumix can be used to replace a proportion of dry blend to improve performance and reduce cost.

Its excellent palatability, combined with good levels of protein and energy also make Regumix ideal to balance buffer feeds for grazing animals.

About Regulated Release

This unique, patented process, developed by ED&F Man Liquid Products, is designed to give rumen bacteria exactly what they need to thrive - a balanced and synchronised supply of energy and protein, leading to increased microbial protein production and better animal performance.

- Excellent source of fermentable energy and nitrogen to ensure efficient microbial protein production
- Harnesses the benefits of urea as an excellent and cost-effective protein source
- Improves palatability and intakes, and promotes efficient forage digestion
- Improving ruminant performance at the same time as cutting feed costs

How to use Regumix

Regumix can be stored and handled as easily as conventional molasses blends - and provides similar benefits in terms of feed texture and palatability. It is easy to use in a range of feeding systems - from TMR wagons to simply layering onto forages along feed passages or in troughs.

Typical feeding rate for cows is 2kg/head/day, so a 10 tonne delivery, stored conveniently in a bulk tank, will support 100 cows for 50 days. Typical feeding rate for sheep is 0.25kg/head/day.

Fresh-Guard

Regumix is available with a Fresh-Guard option.

Delivery size options: 5mt to 29mt
